

Block Shadow IT and Ensure Only Trusted Software Runs on macOS

Maintaining robust security while ensuring operational efficiency is paramount for modern organizations, especially those managing extensive device fleets. macOS Admins may find themselves flying blind when it comes to what’s actually running on their endpoints. This is why Airlock Digital and Jamf have created an integration that enhances security and streamlines management for macOS devices.

The native integration between Airlock Digital and Jamf helps organizations define what runs across macOS environments without disrupting software deployment workflows. Jamf gives IT teams a centralized way to deploy, manage, and secure Apple devices. When software is deployed through Jamf, it is automatically approved for execution, everything else falls under Deny by Default application control, so only explicitly trusted applications, scripts, browser extensions, and files are allowed to run.

Key Benefits

- Prevent Living off the Land (LOTL) abuse**
 Restrict trusted macOS binaries and scripts to their intended use, blocking unauthorized execution paths attackers rely on.
- Trust Jamf-delivered apps automatically**
 Applications deployed via Jamf are automatically allowed by Airlock Digital, streamlining policy enforcement.
- Enforce Deny by Default execution control**
 Only known and verified software can run, significantly reducing an endpoint's attack surface.
- Reduced security operations burden**
 Cut down on time spent triaging alerts, remediating compromised machines and responding to unauthorized software-related incidents.
- Strengthen compliance**
 Enforce consistent execution policies across every macOS endpoint, providing auditors with clear, demonstrable evidence of control.
- Preserve end-user experience**
 Transparent enforcement means users can work without constant security interruptions.
- Deliver security without the performance hit**
 Deny by Default upholds security without sacrificing speed, usability or operational agility.

Together, Airlock Digital and Jamf help security and IT teams reduce unauthorized software execution, strengthen compliance, and maintain a better end-user experience across managed macOS fleets.
